

SureQR – Online Document Security

WHAT TO SECURE

1. Documents
2. Asset Labels
3. Employee ID Cards

CUSTOMIZE QR CODE

Change QR code size, logo, margins, label, colors and other parameters to match your brand identity

DOMAIN

Set your domain in web addresses of verification pages

QR CODE TRACKING

Know when users scan the QR code and where they are located

SPECIFICATION

PHP 8.2
MySQL 8
Bootstrap 3.3.4
JavaScript

SureQR is a web application running at sureqrapp.nizamer.com. It enables you to create online verifiable documents by embedding dynamics QR code on the documents. QR codes can be used to secure all kinds of documents that require validation such as certificates, letters, asset labels, employee ID cards, pay slips, statements etc.

SureQR prints QR code that contain URL. This URL starts with official subdomain of the company issuing the document. When the QR is scanned, you can see the URL inside QR code and visit the URL in web browser such as Google Chrome. The web page (referred as Verification Page afterwards) opens on official subdomain of the company that issued the document. Verification page authenticates that the document is valid and contains the particulars mentioned thereon. The page optionally includes digital copy of the document. This type of QR code is called dynamic QR code which are generally used for document verification.

HOW AUTHENTICATION WORKS

After a user of a company signs up, he adds and verifies subdomain of the company by adding A record with domain registrar. It enables SureQR to verify documents on subdomain of the company. The person who scans QR code on document will see document being verified on verification page with official domain of the company as if the company published it.

Verification page on official subdomain of a company ensures the beneficiary and other parties that the document is not a counterfeit and has been issued by the official body or corporation.

The URL of verification page contains two important parts: Domain and Unique ID. We have already discussed about the domain. Unique ID, as the name suggests, is different for each document added in SureQR. It is a HEX value of an arbitrary length string of cryptographic random bytes generated programmatically for each document. The length of Unique ID can also be configured.

FEATURES

- Unlimited Documents
- Unlimited Employees
- Unlimited Assets
- Branded QR Codes
- Embed QR Code on Electronic PDF
- Customizable Verification Page
- QR Code Tracking
- Help Center
- Ticket Support
- Online Storage
- Verification Pages on Your Domain
- Verification Pages on HTTPS
- API

Deployment Options

IMPORT

Import list of documents, assets and employees to generate QR codes in bulk

API

Integrate in your application and do operations like list, view, insert, update and delete in SureQR from your application seamlessly

DOCUMENTATION

Full fledged Help Center that has articles explaining every function of SureQR step-by-step.

All pages have relevant article link for Help Center
